Re: P2052
Addendum to Traffic Impact Study Dated July 27, 2020
Proposed Commercial Development (6 Tracts)
Johnson Avenue (Highway 49)
Jonesboro, Arkansas

Mr. Stem:

Peters & Associates Engineers, Inc. prepared this Addendum to a traffic engineering study report dated July 27, 2020 relating to a commercial development to consist of six tracts and to be located north of Johnson Avenue (Highway 49) and south of Hudson Road in Jonesboro, Arkansas. This addendum addresses projected traffic conditions (with assumed full development of the site) to include the previously studied intersection of Johnson Avenue and the proposed Visions Avenue as well as the coordinated traffic signal operation of the intersections of Johnson Avenue and Old Greensboro Road and Johnson Avenue and Airport Road (Highway 351 South). The additional intersections have been included in the analysis per the request of Mr. Craig Light with the City of Jonesboro. All methodologies and calculations used in the traffic study report dated July 27, 2020 were also utilized as a part of this Addendum and are still valid.

Per the City's request, after review of the traffic study report dated July 27, 2020, capacity and level of service (LOS) analysis was performed for projected traffic conditions for full build-out of the development for the AM and PM peak hours for the study intersections. City-provided traffic signal timing and phasing for the additional intersections has been included in this analysis for projected traffic conditions. Projected traffic volumes are depicted on the following figures:

- Figure A, "Projected Traffic Volumes - AM Peak Hour."
- Figure B, "Projected Traffic Volumes - PM Peak Hour."

Traffic volumes shown on Figures A and B are the values used in capacity and level of service calculations conducted as a part of this Addendum. The effect of existing background traffic (i.e. the adjacent street non-site traffic which exists) and projected traffic associated with the site development has thus been accounted for in this analysis for each of the study intersections.

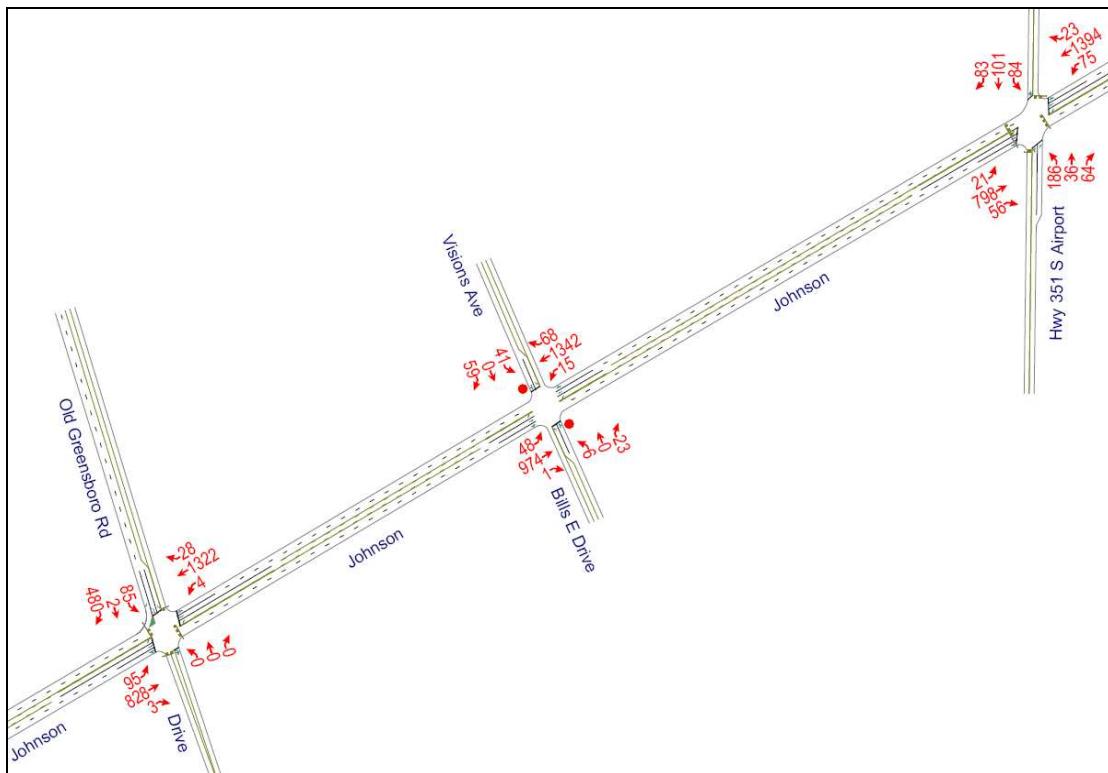

Figure A - Projected Traffic Volumes - AM Peak Hour

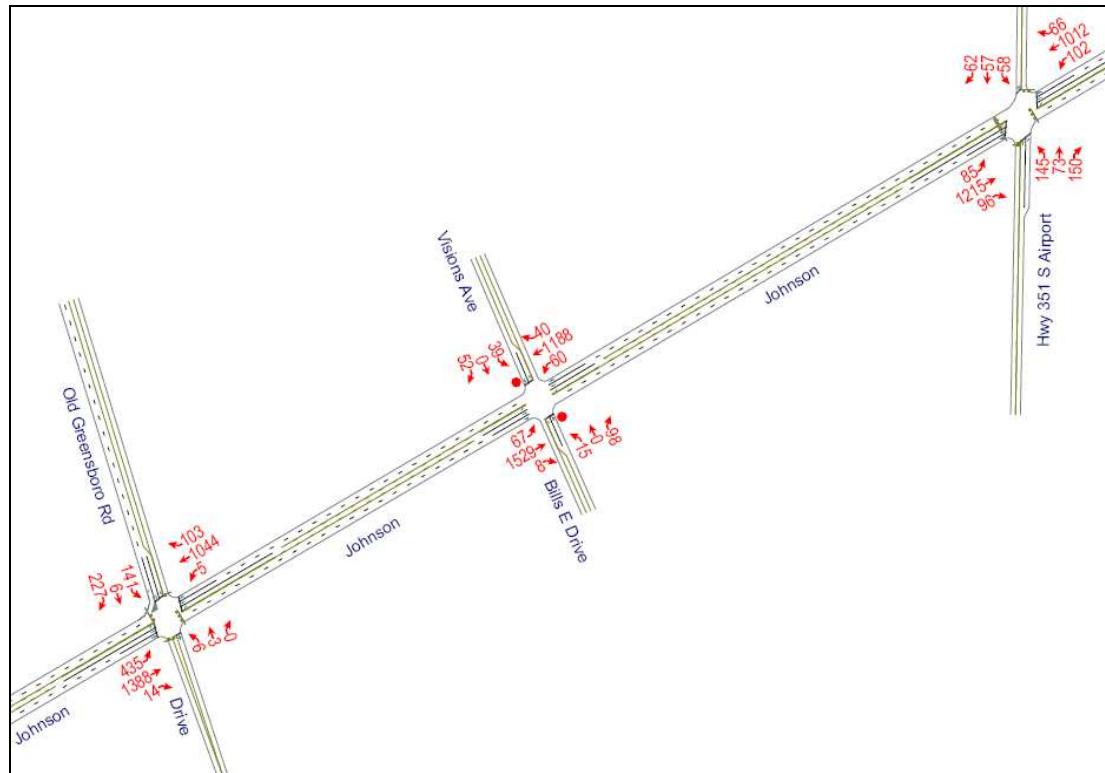

Figure B - Projected Traffic Volumes - PM Peak Hour

The operating conditions projected to exist at the study intersections are summarized in Table A, "Level of Service Summary - Projected Traffic Conditions." Detailed results for these capacity calculations are included with this Addendum.

PROJECTED TRAFFIC CONDITIONS		Traffic Control	Eastbound Left-Turn	Eastbound Thru	Eastbound Right-Turn	Westbound Left-Turn	Westbound Thru	Westbound Right-Turn	Northbound Left-Turn	Northbound Thru	Northbound Right-Turn	Southbound Left-Turn	Southbound Thru	Southbound Right-Turn	Overall Intersection	Avg. Control Delay Seconds / Vehicle	Intersection Capacity Utilization (%)
INTERSECTION	PEAK HR								PEAK HOUR - LEVEL OF SERVICE								
Johnson Avenue and Visions Avenue / Bill's East Access Drive	AM	"STOP" SIGN	B	A	A	A	D	A	E	C	n/a					1.5	57.8%
	PM		B	A	B	A	E	B	E	B	n/a					1.8	67.3%
Johnson Avenue and Old Greensboro Road	AM	SIGNAL	A	B	A	B		A	D	D	C	B				16.6	80.6%
	PM		D	F	D	D		E	E	D	B	F				123.2	85.0%
Johnson Avenue and Airport Road / Hwy 351 South	AM	SIGNAL	B	C	B	C	F	A	E	C						34.9	91.2%
	PM		B	C	B	C	E	A	D	C						29.0	80.6%

Table A - Level of Service Summary - Projected Traffic Conditions

As indicated in Table A, at the study intersection of Johnson Avenue and the proposed Visions Avenue / Bill's Cost-Plus Supermarket east drive, it appears that including analysis for the coordination of the adjacent traffic signalized intersections provides some measure of vehicle platooning on Johnson Avenue by virtue of the coordinated operation which in turn reflects greater vehicle gaps in the Johnson Avenue traffic stream. This has resulted in reduced delay, reduced queues, and better LOS for both the north and south approaches on Visions Avenue than what was found in the analysis of the previous traffic study. Both northbound and southbound vehicle queues and vehicle delays at the intersection of Johnson Avenue and the proposed Visions Avenue / Bill's Cost-Plus Supermarket east drive are calculated to be less than two vehicles / delayed less than 30 seconds.

There are vehicle movements which operate at what calculates as worse than LOS "D" for the AM and PM peak hours at the coordinated traffic signal operations at the intersections of Johnson Avenue and Old Greensboro Road and Johnson Avenue and Airport Road (Highway 351 South) utilizing City-provided traffic signal timing and phasing. However, Arkansas Department of Transportation (ARDOT) has intersection improvement plans (ARDOT Job 100875) in the vicinity of the study area that includes these two intersections. Once these ARDOT planned intersection improvements are completed at these two intersections, there is expected to be an increase in operational capacity at both intersections, thereby resulting in improved LOS. The ARDOT Job 100875 has funding in place and is scheduled for bid letting by ARDOT in April 2021.

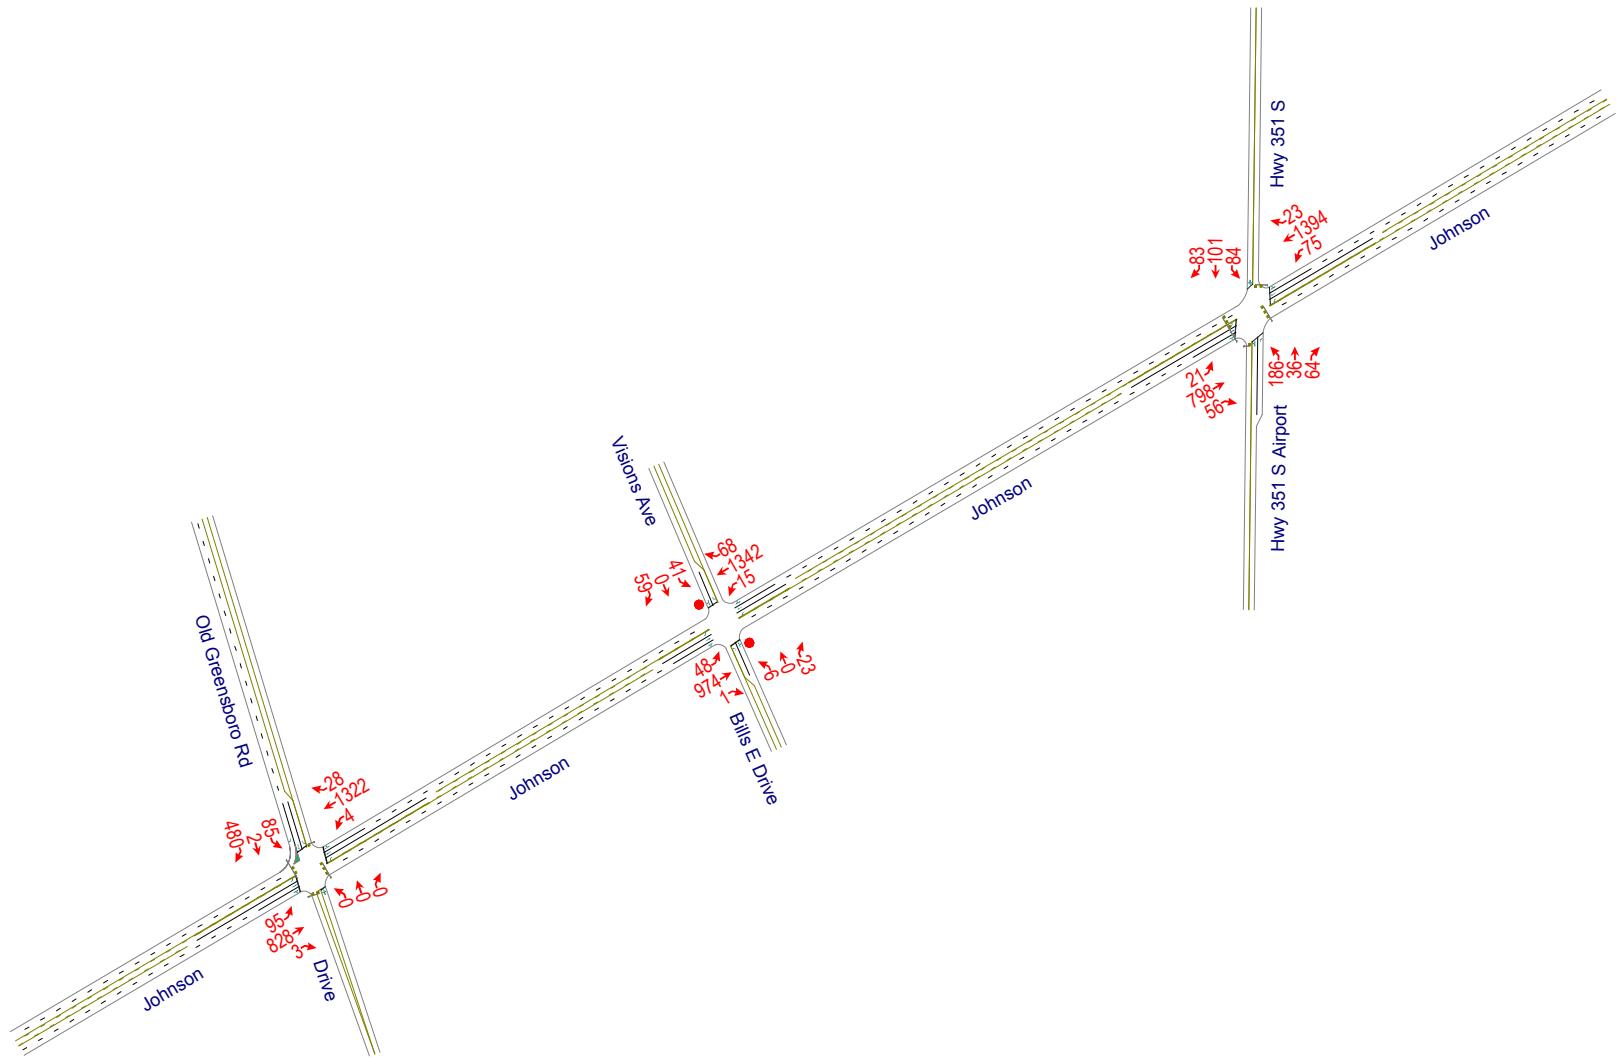

The conclusion of traffic operational findings associated with this Addendum is that additional traffic expected to be generated by the development as proposed or assumed can be accommodated by the existing adjacent Johnson Avenue lane geometry and Visions Avenue, as proposed, to consist of a southbound left-turn lane, a southbound thru/right-turn lane and a northbound receiving lane at Johnson Avenue, without discernable impact on traffic flow along Johnson Avenue in the vicinity. Access to the six tracts via Visions Avenue is better than multiple access points along Johnson Avenue. Other findings and recommendations included in the traffic study report dated July 27, 2020 are still valid for projected traffic conditions.

Please let me know if you need additional information or comment.

Sincerely,
PETERS & ASSOCIATES, ENGINEERS, INC.

Ernest J. Peters, P.E.
 President

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 106 (88%), Referenced to phase 2:EBWB, Start of Green

Natural Cycle: 130

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.10

Intersection Signal Delay: 123.2

Intersection LOS: F

Intersection Capacity Utilization 85.0%

ICU Level of Service E

Analysis Period (min) 60

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.
