

# Jonesboro Crime Distribution: Spatial Distribution and Contributing Factors

**Study Results**  
Presented to the City Council, Jonesboro, AR  
Public Safety Committee  
June 12, 2012

Basia Combs, Crime Analyst  
Jonesboro Police Department  
Office of Crime Analysis & Criminal Intelligence

6/18/2012

## Table of Contents

	Slide (s) Number
Executive Summary	2
Review of current crime distribution in Jonesboro	4-17
Purpose of the study	18
Causes of Hot Spots – Research Review	19 - 23
Contributing Factors	24 - 27
Methodology	28 - 29
Results & Analysis	30 - 56
Summary	57 - 58
Recommendations	59 - 60
Questions/Discussion	61

6/18/2012 2

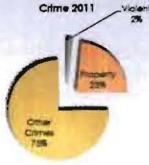

## Executive Summary

Crime in Jonesboro	<ul style="list-style-type: none"> <li>• 2011 total reported incidents: 20,267</li> </ul>
Crime and Place	<ul style="list-style-type: none"> <li>• Spatial distribution of Crime in Jonesboro – Hot Spots</li> </ul>
Research	<ul style="list-style-type: none"> <li>• Spatial relationship</li> <li>• Multiple Regression</li> </ul>
Contributing Factors	<ul style="list-style-type: none"> <li>• Results</li> </ul>
Recommendations	<ul style="list-style-type: none"> <li>• City</li> <li>• JPD</li> </ul>

## Jonesboro Crime 2011

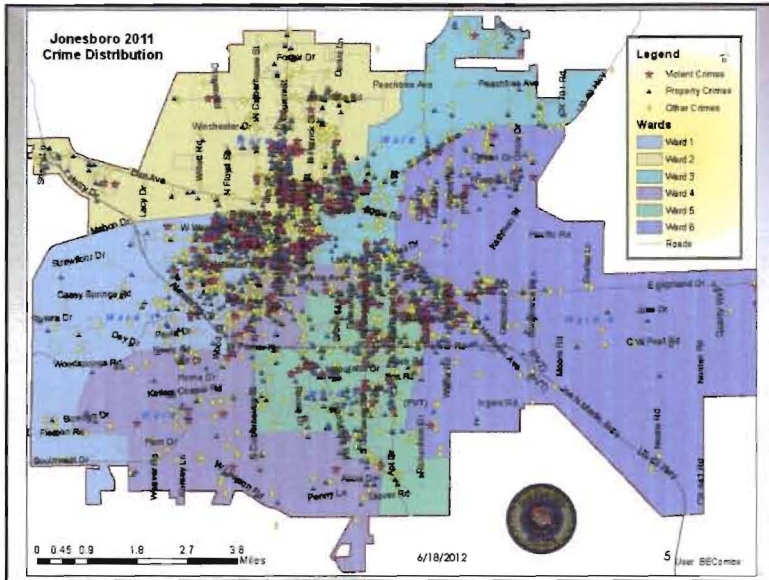

- 
**Violent Crimes (n = 313)**
  - Willful Homicide
  - Forcible Rape
  - Aggravated Assaults
  - Robbery
- 
**Property Crimes (n = 4,726)**
  - Larceny/Theft
  - Motor Vehicle Theft
  - Burglary
  - Arson
- 
**Other Crimes (n = 15,228)**
  - Crimes of Proactive Policing
  - All Other Crimes

Crime 2011

- Violent 2%
- Property 23%
- Other Crimes 73%

6/18/2012 4

## Spatial Density Maps

### Kernel Density

Kernel density mapping is a Geographic Information Systems (GIS) analysis technique that creates a continuous surface map based on point data

Density surfaces are effective at identifying where features are **concentrated** – highlighting areas of intense activity

These **areas of intense activity are called hot spots**

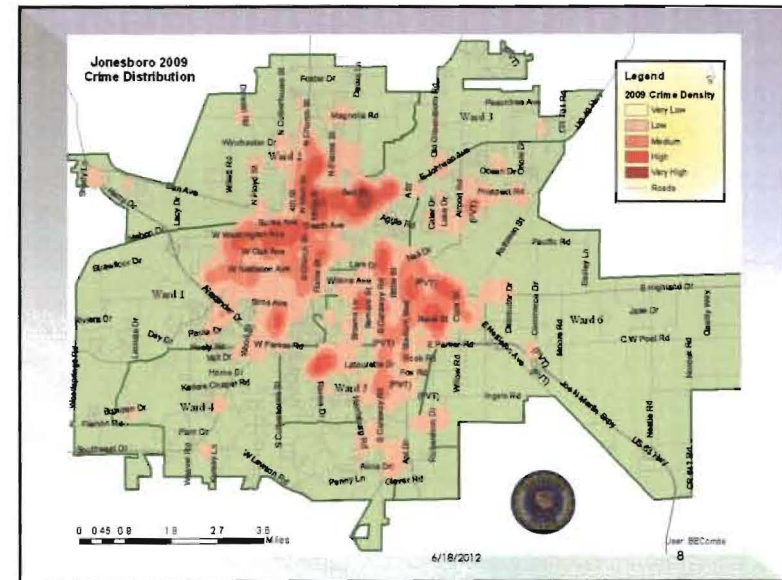

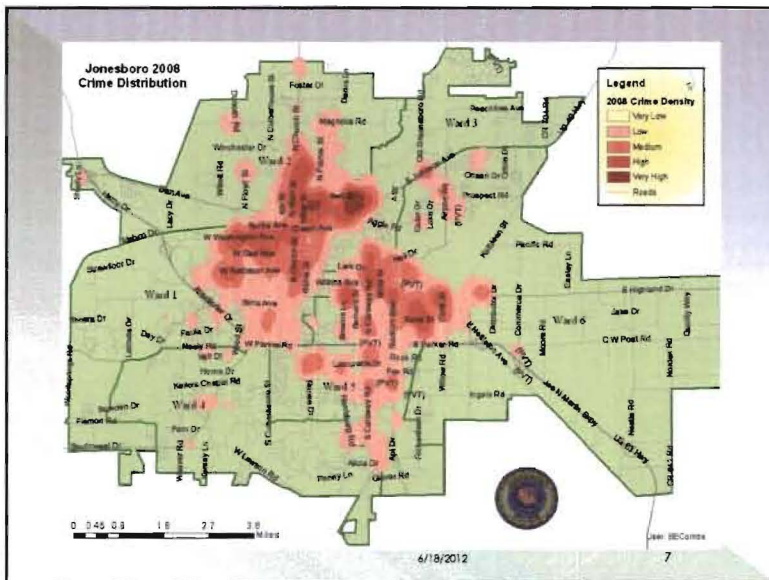

**Hot spot analysis** helps police identify high-crime areas, types of crime being committed, and the best way to respond

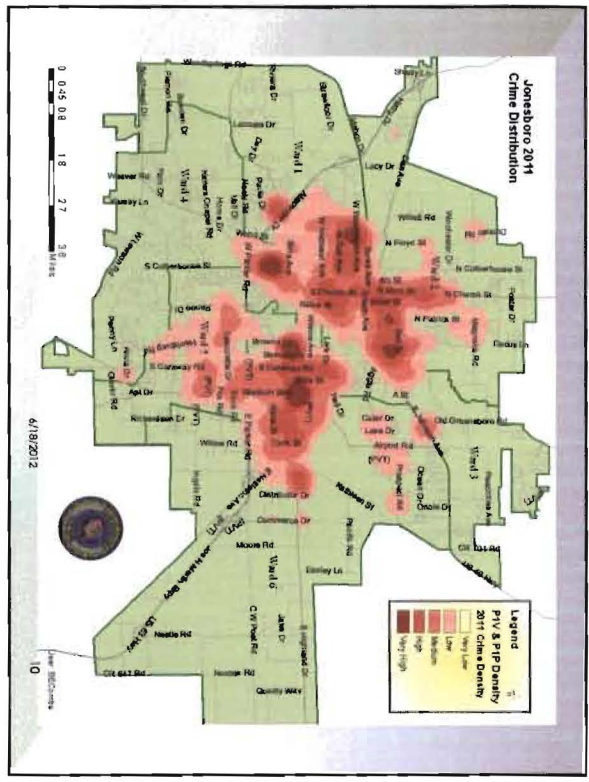

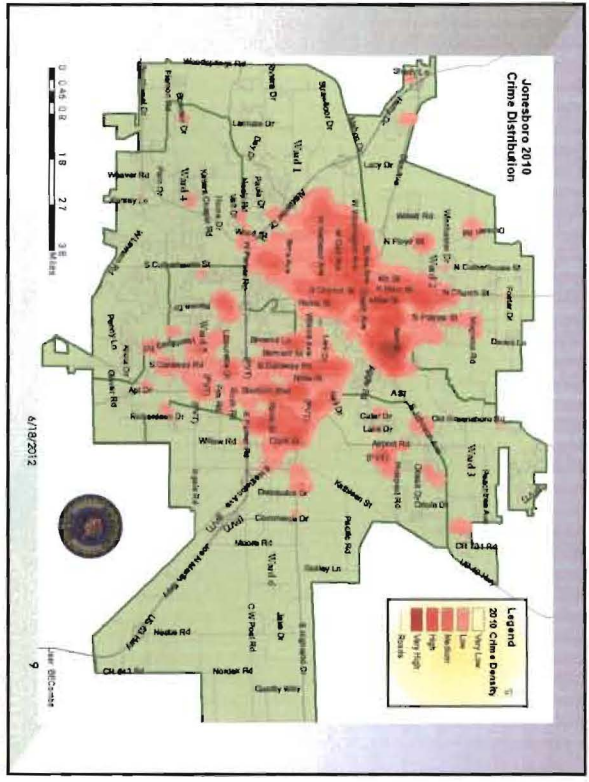

- The procedure for creating a kernel density map surface is:
  - An invisible grid is laid over the study area
  - A search radius is specified for the GIS to define the neighborhood around each cell center
  - The number of features that fall within that neighborhood are counted and divided by that area
  - The calculated value is assigned to the cell and the process is repeated
  - This creates a running average of features per area to create a smoothed, continuous surface

0 0.45 0.9 1.8 2.7 3.6 Miles

# 2011 Crime Distribution by Category

6/18/2012

11

## Distribution of Crime

- Observation: persisting hot spots of crime  
→ specific locations
  - Is this distribution random or is there an underlying reason for this distribution?
  - If distribution is not random, what are the drivers of crime in those specific locations?

## Crime Distribution: Clustered, Dispersed, or Random?

- Spatial Autocorrelation & Moran's I
  - Given a set of features and an associated attribute, the Spatial Autocorrelation tool evaluates whether the pattern expressed is clustered, dispersed, or random
    - When the z-score or p-value indicates statistical significance, a positive Moran's I index value indicates tendency toward clustering while a negative Moran's I index value indicates tendency toward dispersion

## Crime Distribution: Clustered, Dispersed, or Random?

In order to determine whether there is a significant spatial clustering in all three crime categories and that the clustered pattern was not the result of random chance, the spatial autocorrelation analyses were conducted

The results of Moran *I* tests indicate that there is a statistically significant ( $p = 0.000$ ) high to strong positive relationship between each crime categories and their respective distribution

There is less than 1% likelihood that the clustering of all three crimes categories in certain areas of Jonesboro is due to a random chance

What factors account the most to this clustering of crime?

- [View Violent Crimes Moran I full report](#)
- [View Property Crimes Moran I full report](#)
- [View Other Crimes Moran I full report](#)

6/18/2012

17

## Purpose

The Need: Since the density is not only having an evident history of crime but is also spreading out and there is a strong spatial correlation between crime & place, it is crucial to determine what factors account the most to this distribution.

6/18/2012

18

## Causes of Hot Spots

### Repeat places hot spots

Underlying causes: Routine activity theory helps to explain why crime often is concentrated at specific places. In particular, routine activity points to how behavior is regulated at the location by place managers—owners of places or people acting on an owner's behalf.

### Repeat victimization hot spots

Underlying causes: Repeat crime places with different victims and repeat victimization with different places have different causes. Repeat crime places (with different victims) can be attributable to the behavior of place managers, but if the victimizations occur at different places, place managers have less of a role. In those cases, one should look at the occupations commuting patterns, or lifestyles of the potential victims.

### Repeat streets hot spots

Underlying causes: Offenders find targets while going about their normal legitimate business—going to and from work, recreation, shopping, school, and other nodes of activity. Potential targets that are not along the routes or near nodes used by offenders will unlikely be victimized, but those close to offenders' routes and nodes have elevated risks of victimization.

- **Neighborhoods and other area hot spots** (see following 4 slides for detail explanation)
  - **Social disorganization** theory - constant residential turnover, poverty
  - **Social efficacy** - Lack of willingness of local residents to intervene for the common good; no mutual trust and solidarity among neighbors
  - **Broken windows** theory - crime is likely to flourish in areas with high levels of physical and social disorder
  - **Crime opportunity** theories - concentration of crime targets (bus stops, shops, fast food, other businesses etc)

6/18/2012

19

## Neighborhoods and other area hot spots

### SOCIAL DISORGANIZATION THEORY

This theory suggests that the natural ability of people to control deviancy in their neighborhoods is impaired in some areas by constant residential turnover and net outmigration.

- These changes either disrupt social networks or prevent such networks from forming.
- Since these networks, are responsible for most social control in neighborhoods, their absence leads to higher levels of deviancy.
- Poverty, also have been identified as undermining social networks.

6/18/2012

20

## Neighborhoods and other area hot spots

### SOCIAL EFFICACY

Recent evidence from Chicago points to the role of social efficacy, which is "the willingness of local residents to intervene for the common good." It depends on "mutual trust and solidarity among neighbors" (Sampson, Raudenbush, and Earls, 1997, page 919)

- Neighborhoods that have a great deal of social efficacy have less crime and disorder than neighborhoods that have low levels.
- Social efficacy—like disorganization and social networks—is not a property of individual people or places, but a characteristic of groups of people.

6/18/2012

21

## Neighborhoods and other area hot spots

### BROKEN WINDOWS THEORY

The broken windows theory also is an area theory of crime concentration.

Wilson and Kelling (1982) claim that in most well-functioning neighborhoods, small transgressions of social norms (e.g., failure to keep one's yard tidy) result in social pressures to bring the offending party into compliance.

Once a place becomes untended, however, it undermines the willingness and ability of residents to enforce social order.

- Consequently, residents withdraw from enforcing neighborhood norms, which allows further deviancy to occur.
- This in turn results in additional withdrawal and fear and the neighborhood begins to spiral downward.

6/18/2012

22

## Neighborhoods and other area hot spots

### CRIME OPPORTUNITY THEORIES

Another explanation for neighborhood-level hot spots comes from routine activity theory and related theories that point to crime opportunities as the principle cause of crime.

Rather than concentrations of offenders or the absence of social controls, opportunity theories suggest that analysts should look for concentrations of crime targets.

For example, a dense urban neighborhood with no off-street parking will have many cars parked on the street. Such an area may become an area hot spot for thefts from vehicles.

A suburban subdivision inhabited by dual-income families will have few people at home during weekdays. Since their property is unprotected, their neighborhood can become an area burglary hot spot. Note that in this type of situation, several layers of hot spots can exist simultaneously. Within area hot spots, defined by the subdivision in this example, might be streets with even greater numbers of burglaries, and some of the homes on these streets may be broken into multiple times.

6/18/2012

23

## Contributing Factors

Deduced from Neighborhood Hot Spots Theories

- Rental Properties
- Population Density
- Vacant Housing
- Probationers/Parolees
- Household Income
- Education
- Targets of Crime

6/18/2012

24

## Crime Distribution in Relation to Rental Properties

- Some rental properties were observed to have a higher concentration of crime than others, apartments specifically
- Study 1: all apartment complexes in Jonesboro by ownership and their spatial relationship to crime (Combs, 2011)
  - 7 methods of analysis
  - Locations with highest crime concentration identified

6/18/2012

25

6/18/2012

26

## Crime Distribution in Relation to Rental Properties

- Some of the top 10% of rental properties with highest crime were recognized as Jonesboro Urban Renewal & Housing Authority's (JURHA) and Section 8, specifically
- Study 2: separates Section 8 locations, JURHA locations, and top 10% rental locations with highest crime from within rental properties

6/18/2012

27

## Methodology Variables (data available)

### Independent Variables (contributing factors)

- Rental Properties
  - Top 10% of Rental Properties with Highest Crime
  - Section 8
  - JURHA
- Population
- Vacant Units
- Probationers/Parolees
- Household Income

### Dependent Variables (outcome)

- Violent Crime
- Property Crime
- Other Crime

6/18/2012

28

### Methodology Analysis

#### Correlation (Pearson's)

The Pearson R correlation tells us the magnitude and direction of the association between two variables

- Range -1 to +1, where:
  - 0 = no association
  - The closer the correlation to +1 or -1, the stronger the correlation
  - "+" or positive correlation = as one increases so is the other
  - "-" or negative = as one increases, the other decreases

#### Multiple Regression

A statistical method used to examine the relationship between a variable of interest (dependent variable) and **one or more** explanatory variables (predictors)

- Focus on the following factors:
  - Strength of the relationship
  - Direction of the relationship (positive, negative, zero)
  - Goodness of model fit
- Allows to calculate the amount by which the dependent variable changes when a predictor variable changes by one unit (holding all other predictors constant)
- Just like correlation, if an explanatory variable is a significant predictor of the dependent variable, it doesn't imply that the explanatory variable is a cause of the dependent variable, but rather that it accounts to the specific distribution

6/18/2012 29

## Correlation

	Rent - Top 10% Crime	JURHA	Section 8	Vacant	Probation /Parole	Population	Median Income
Violent Crime	r = .13 sig = .000	r = .32 sig = .000	r = .54 sig = .000	r = .46 sig = .000	r = .30 sig = .000	r = .46 sig = .000	r = -.13 sig = .000
Property Crime	r = .14 sig = .000	r = .18 sig = .000	r = .34 sig = .000	r = .35 sig = .000	r = .18 sig = .000	r = .38 sig = .000	r = -.11 sig = .000
Other Crime	r = .26 sig = .000	r = .32 sig = .000	r = .48 sig = .000	r = .49 sig = .000	r = .32 sig = .000	r = .44 sig = .000	r = -.21 sig = .000

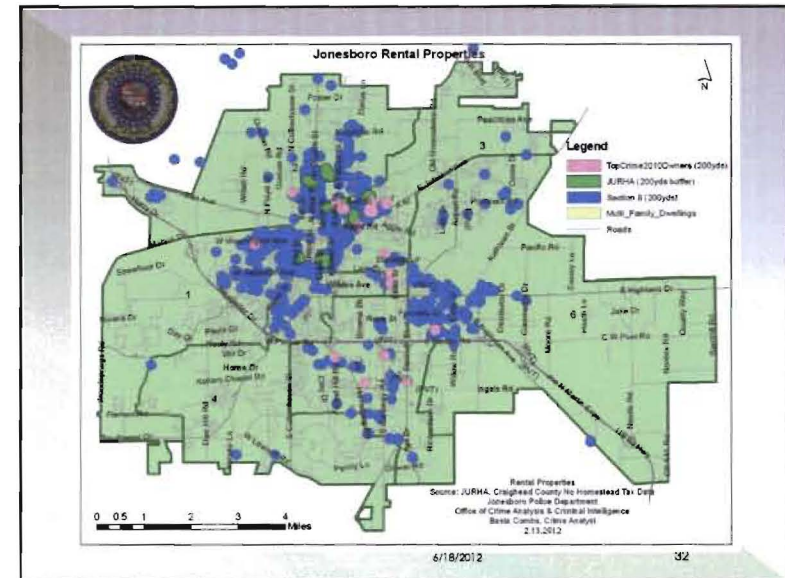

**Accepted and Rejected Variables**

- Accepted (based on violent crime)
  - Section 8 = strong positive relationship
  - Population = strong positive relationship
  - Vacant = strong positive relationship
  - JURHA = moderate positive relationship
  - Probation/Parole = moderate positive relationship
- Rejected (based on violent crime)
  - Top 10% of Rental Properties w/highest crime = negligible relationship
  - Median Income = negligible relationship

6/18/2012 30

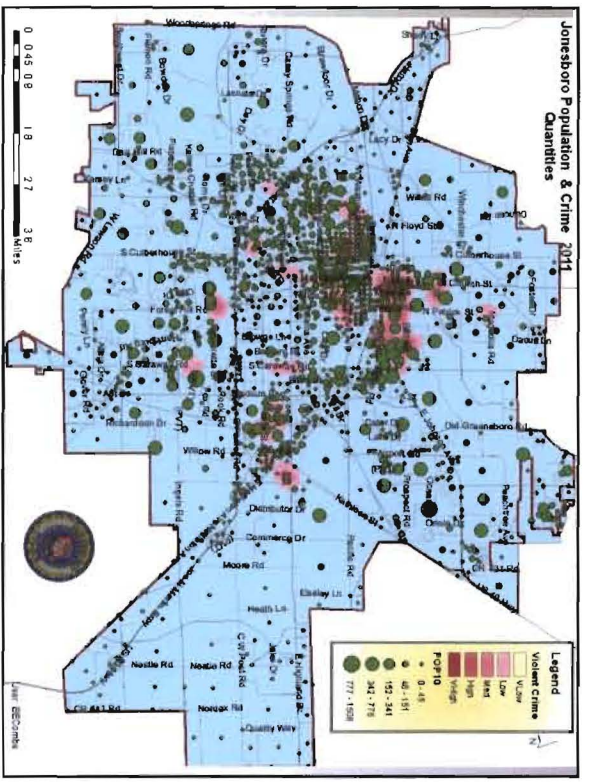

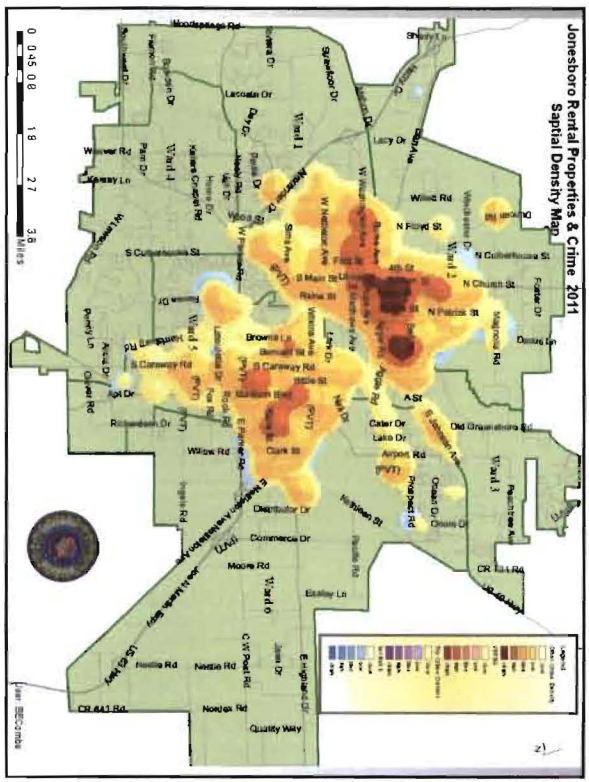

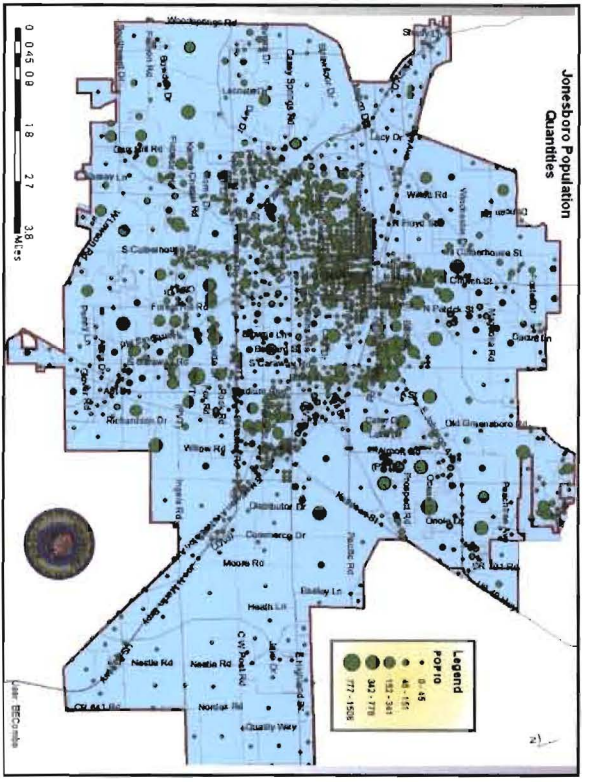

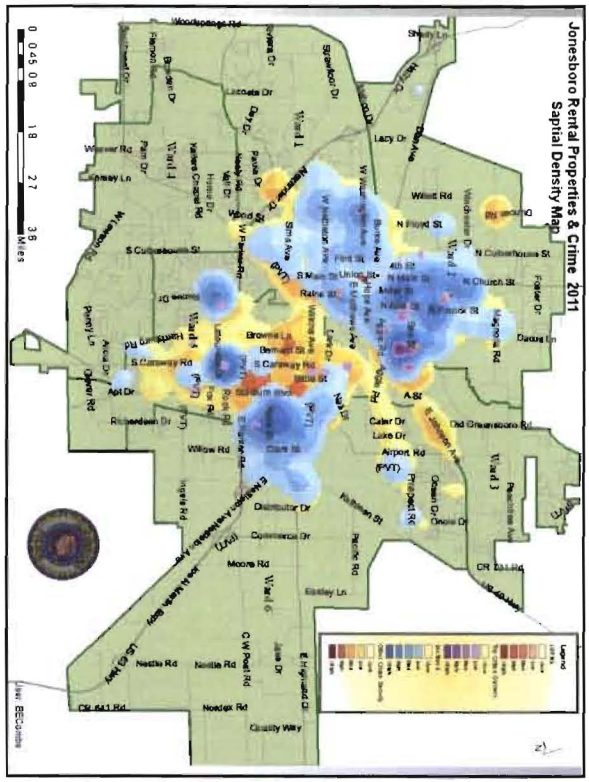

## Spatial Relationship

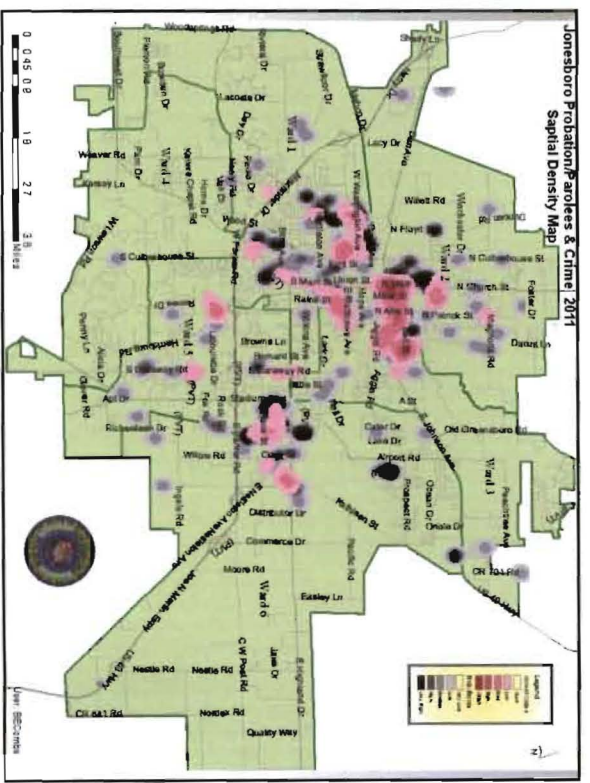

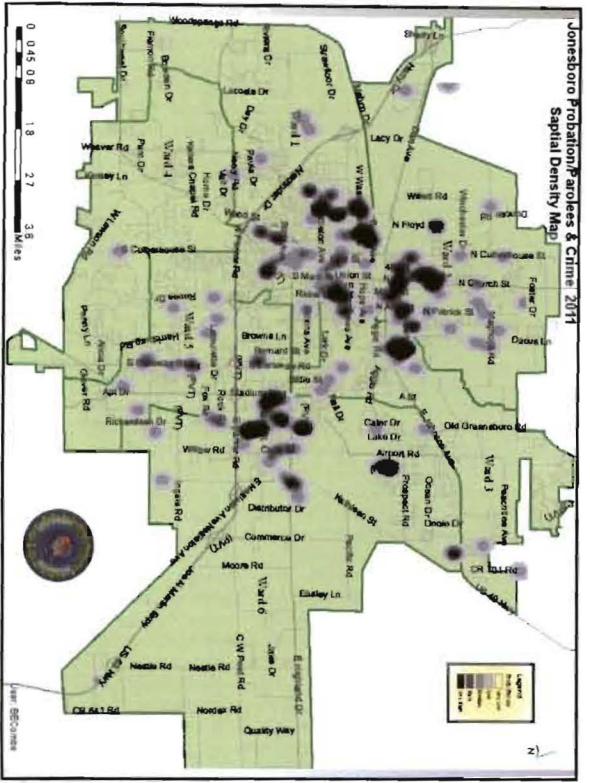

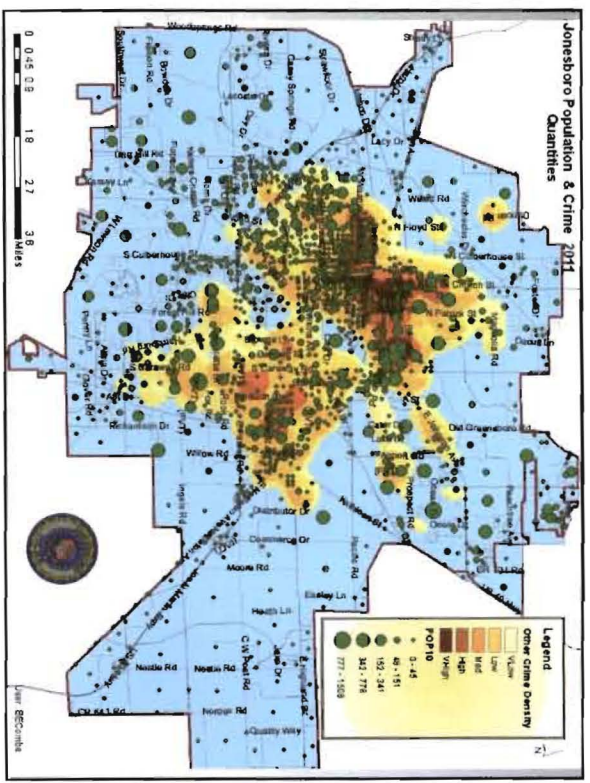

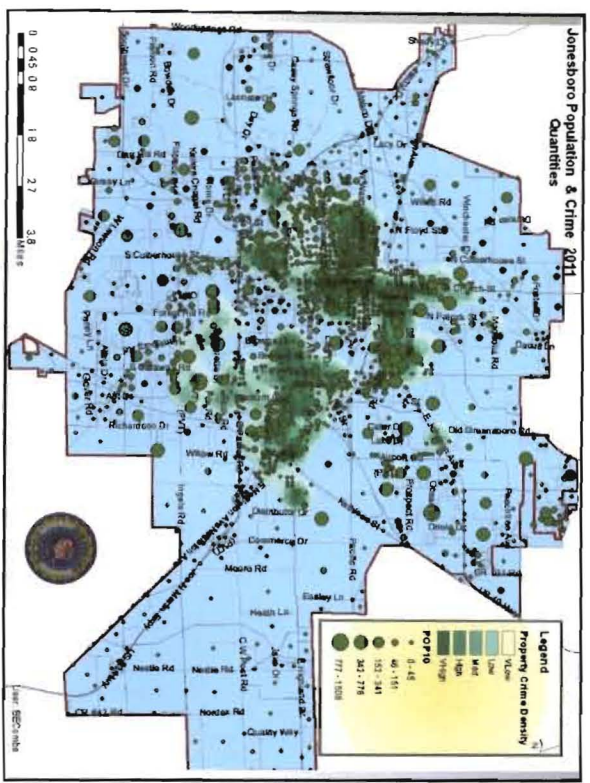

6/18/2012 31

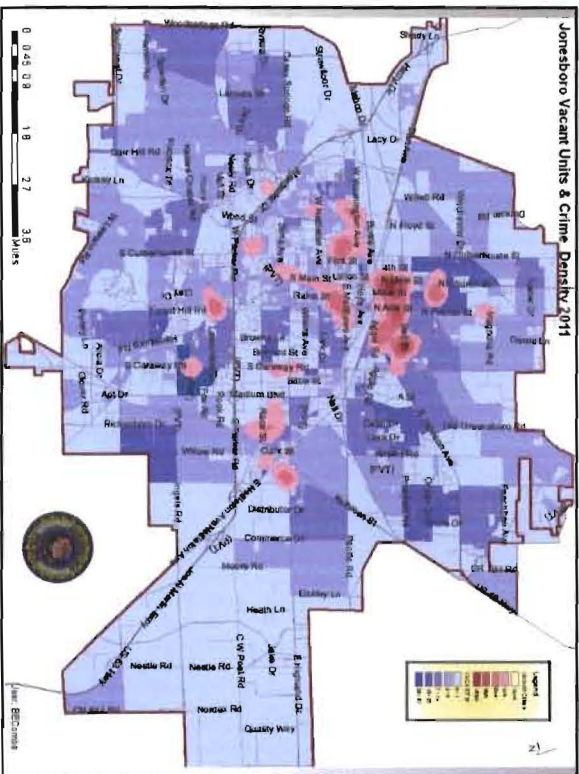

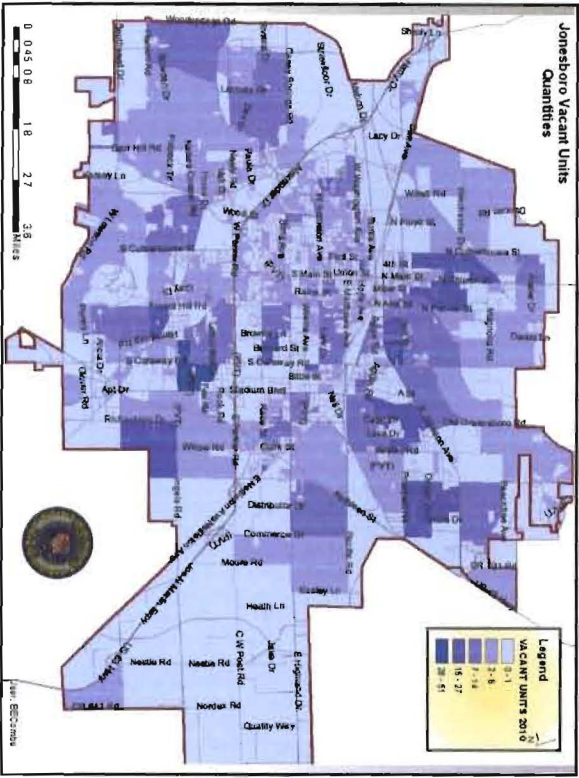

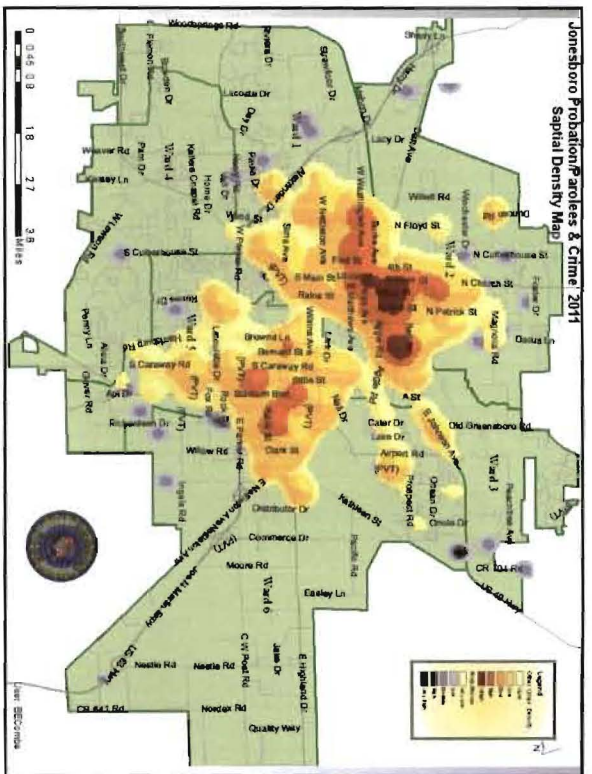

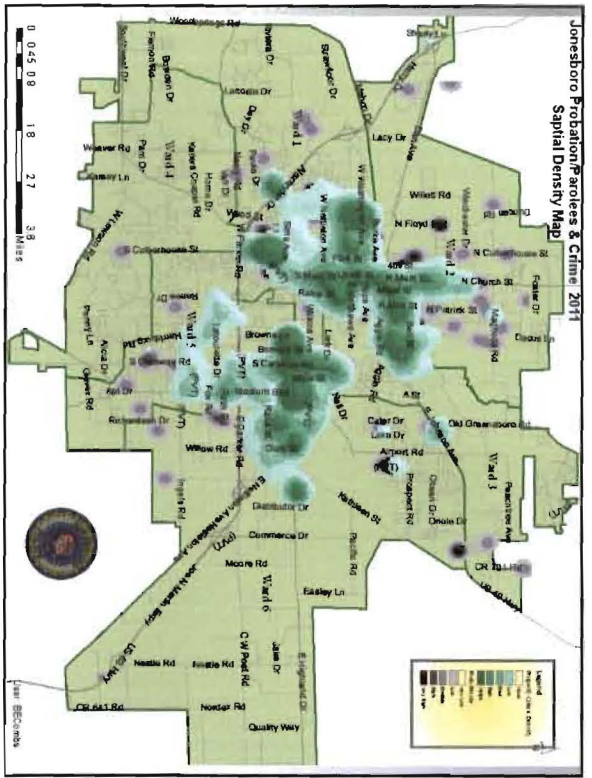

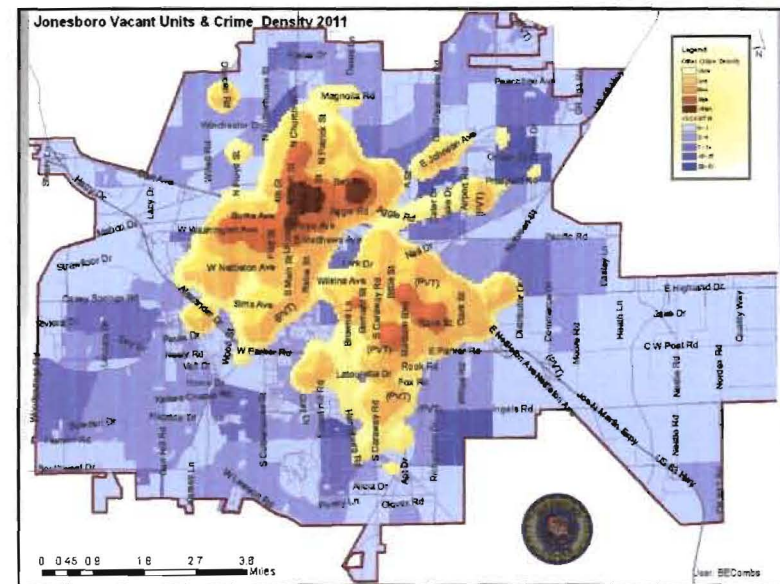

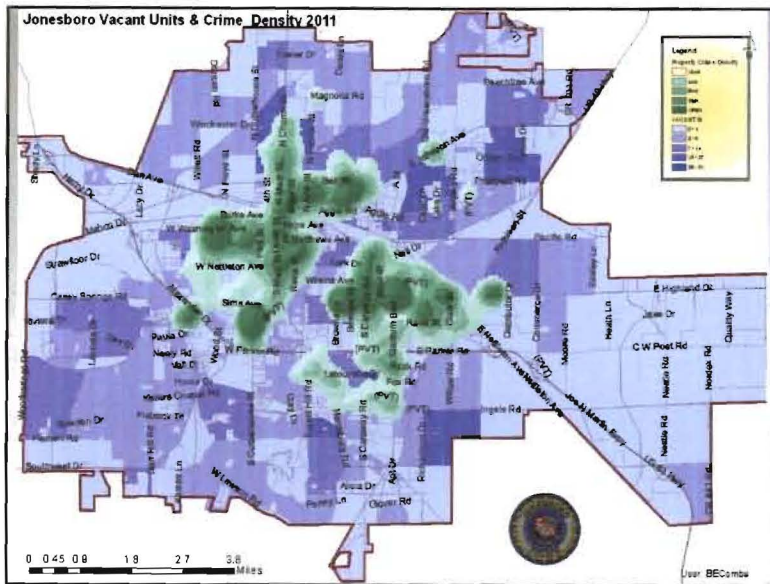

### Multiple Regression Results: Dependent Variable = Violent Crime

- R Square = .37
- Sig. = .000

Coefficients <sup>a</sup>							
Model		Unstandardized Coefficients			Standardized Coefficients	t	Sig.
		B	Std. Error	Beta			
1	(Constant)	.044	.015		2.914	.004	
	Sec8	.054	.005	.302	10.618	.000	
	JURHA	.056	.007	.165	7.914	.000	
	ProbParole	.148	.036	.365	4.057	.000	
	pop10	.001	.000	.148	5.574	.000	
	vacant10	.028	.005	.170	5.565	.000	

<sup>a</sup> Dependent Variable: ViolentCr

6/18/2012 51

### Analysis: Violent Crime

- 37% of violent crime variation is explained by this set of variables
- Section 8 has the strongest effect on violent crime, following by JURHA, Vacant Units, Population, and Probationers/Parolees
- For every unit increase in a respectful variable, we can predict the following change in crime

Independent Variable	Violent Crime Increase per Unit	Violent Crime Increase per 10 Units
Sec8	0.1	0.6
JURHA	0.1	0.6
ProbParole	0.2	1.5
pop10	0.1	0.2
vacant10	0.0	0.3

### Multiple Regression Results: Dependent Variable = Property Crime

- R Square = .184
- Sig. = .000

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.581	.118		4.929	.000
	Sec8	.157	.040	.118	3.921	.000
	JURHA	.183	.057	.075	3.188	.001
	ProbParole	.232	.081	.055	2.823	.010
	pop10	.011	.002	.211	6.977	.000
	vacant10	.172	.040	.132	4.345	.000

a. Dependent Variable: PropertyCrimes

6/18/2012

53

### Analysis: Property Crime

- Over 18% of property crime variation is explained by this set of variables
- Population has the strongest effect on property crime, following by Vacant Units, Section 8, and JURHA
- Probation/Parole not statistically significant
- For every unit increase in a respectful variable, we can predict the following change in crime

Independent Variable	Property Crime per Unit Increase	Property Crime per every 10 Units Increase
Sec8		
JURHA	0.7	2.1
pop10	0.3	2.0
vacant10	0.2	0.3
	0.2	1.7

6/18/2012

54

### Multiple Regression Results: Dependent Variable = Other Crime

- R Square = .36
- Sig. = .000

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	1.530	.198		7.695	.000
	Sec8	.410	.087	.183	6.068	.000
	JURHA	.392	.097	.185	9.193	.000
	ProbParole	2.625	.475	.130	5.580	.000
	pop10	.013	.003	.224	4.629	.000
	vacant10	.804	.087	.244	9.023	.000

a. Dependent Variable: OtherCrimes

6/18/2012

55

### Analysis: Other Crime

- 36% of other crime variation is explained by this set of variables
- Vacant Units have the strongest effect on other crime, following by JURHA, Section 8, Probationers/Parolees, and Population
- For every unit increase in a respectful variable, we can predict the following change in crime

Independent Variable	Other Crime per Unit Increase	Other Crime per every 10 Units Increase
Sec8		
JURHA	0	4
ProbParole	3	26
pop10	0	0
vacant10	0	0

6/18/2012

56

## Summary

It is evident that from all the contributing factors in the model, based on averaged Unstandardized Coefficient Beta, Section 8 has the greatest impact on all the combined crime categories, followed by Vacant Units, Population Density, JURHA, and Probation/Parolees

Category	Impact (%)
Sec8	19%
JURHA	14%
ProbParole	11%
pop10	16%
vacant10	18%

As the Section 8 and JURHA are administered by the same entity, combining these two variables into one helps us even better depict this distribution

Category	Impact (%)
Sec8/JURHA	33%
ProbParole	11%
pop10	16%
vacant10	18%

6/18/2012 57

## Summary

There could be many reasons causing such impact. Examples are:

- Poverty
- Social disorganization
- Persisting unemployment
- Organizational policies and procedures

To find out whether our variables are actually causing crime in our city, we would have to design another study that would include the set of variables proven to cause the crime and control for them in the new model

6/18/2012 58

## Recommendations to the Administration of the City of Jonesboro

### Address social ills related to criminal activities

### Containment (prevent the expansion of crime)

**Reduce Poverty Levels**

Enhance Education

Reduce Unemployment

**Address Alcohol and Drug Dependency**

**Social disorganization** - reduce constant residential turnover & poverty

**Social efficacy** - improve the willingness of local residents to intervene for the common good; create programs that would increase mutual trust and solidarity among neighbors

**Broken windows** - reduce levels of physical and social disorder

**Crime opportunity** - reduce concentration of crime targets (bus stops, shops, fast food, other businesses etc)

6/18/2012 59

## Recommendations to the Police Department

- Disorder**
  - Social Disorder
  - Increased misdemeanor arrests, focusing on enforcement of public order violations such as Public Drinking, Drug Dealing, and Loitering
  - Increased foot and bicycle patrol
- Programs**
  - Housing Study Committee
  - Develop and implement the Crime Hot Spot Reduction & Prevention Program
- Services**
  - Offer background checks
  - Continue education on drug and alcohol resistance
  - Request changes in JURHA management policies
- Prevention**
  - Apply Risk Terrain Modeling to identify other potential hot spots

6/18/2012 60
